TITLE: The production of dielectric laminates with non-alcoholic phenolformaldehyde resins.

SOURCE: Plasticheskiye massy, no. 7, 1963, 28-31

TOPIC TAGS: laminate, phenolformaldehyde, resin, paraformol, cresol, polyoxymethylene.

ABSTRACT: The scope of this study is to produce liquid phenolformaldehyde resins without the use of alcohols which are to be used in the production of laminates. A new method for the preparation of liquid non-alcoholic phenolformaldehyde resins in which a large portion of formaldehyde is replaced by paraformol has been obtained. The ratio of intermediates is taken in such proportions that the water from formaldehyde and from the condensation is used in the formation of the liquid resin. This eliminates many steps from the process such as decantation or distillation, or vacuum drying by which the excess water is removed, the purification step of removing the undesirable by-products. Since there are no losses, the amount of

Card 1/2

L 13365-63

ACCESSION NR: AP3003307

oresol is decreased. The characteristic of the above resin is its rapid change in viscosity upon standing. The production of laminates by a non-alcoholic method has a great economical effect not only by the fact that its material cost is about 16% less than the alcoholic method, but also the absence of alcohol and explosive vapors simplifies the production and increases the production capacity. Other substitutes used in the laboratory preparation of liquid resins was Alpha-polyoxymethylene. Orig. art. has: 8 tables, and 2 figures.

Title : Some data on the state of the nervous system in fencers

Periodical : Fiziol. zhur. 41, 48-54, Jan-Feb 1955

Abstract : Investigated the state of the nervous system in both beginning and advanced fencers, ranging in age from 14 to 39. Determined the chronaxy of the biceps and triceps brachii of both arms, both before and after fencing lessons, at various stages of training; determined the speed of the motor response to visual, auditory, and tactile stimuli; and studied the activity of the autonomic nervous system by pulse count at rest and by oculo-cardiac and orthostatic tests. Tables. Thirteen references, all USSR (8 since 1940).

TITLE: Effect of atomic number of impurities on their distribution  
 coefficient

SOURCE: Zhurnal fizicheskoy khimii, v. 39, no. 11, 1965, 2738-2741

TOPIC TAGS: impurity level, atomic property, metal purification,  
 distribution coefficient, metal crystallization

ABSTRACT: The distribution coefficients of impurity elements have been  
 evaluated for only a small number of elements and in many cases only  
 preliminary determinations were made; therefore, the periodicity of  
 changes of the distribution coefficients of impurities is only qualita-  
 tive. In the aluminum matrix the distribution coefficients of short  
 period impurities displayed one maximum: in the second period Be has  
 the highest value, in the third period--Mg. In long periods two maxi-  
 ma are observed. The first maximum occurs in transition metals: fourth  
 period--Ti, V, Cr; fifth period--Zr, Nb, Mo; sixth period--Ta, W;

Card 1/2

UDC: 541.20

L 13031-66

ACC NR: AP5028582

seventh period--Th. The second maximum falls in the fourth period on Cu, Zr, Ge; in the fifth period on Ag, Cd, In; in the sixth period on Pb and Bi. For indium and thallium matrices each period displays one maximum, primarily in the IB-VB groups. In antimony and bismuth matrices one maximum is displayed in each period, which occur with elements of the IVb-VIb groups. In the silicon matrix one maximum per group is observed, occurring with elements of the IIb-Vb groups and analogous behavior is observed in germanium. In the indium antimonide matrix similar behavior is observed in germanium but sufficiently high values of the distribution coefficients are also displayed by the elements of the IIb and VIb groups. Si, Ge and Sn do not follow the general behavior. It is proposed that the established periodicity of the behavior be used for the prediction of the behavior of impurities during crystallization of metals and semiconductors. Orig. art. has: 2 figures.

TITLE: Silica-free molds for casting high-temperature alloys and refractory metals

SOURCE: Liteynoye proizvodstvo, no. 9, 1965, 1-3

TOPIC TAGS: metal casting, silica, refractory metal, nitrate, high temperature alloy

ABSTRACT: Although previous studies have demonstrated the unsuitability of  $SiO_2$  as a molding material for casting refractory metals and alloys, most binders used in investment-pattern casting contain  $SiO_2$  and a radical solution of this problem would be the use of silica-free binders with chemical properties analogous or close to those of the refractory materials (oxides). Ethylsilicate-type silicones meet this need but they are too scarce and expensive. Two of the authors (Ya. I. Shklyenik and I. S. Matusevich. Author's Certificate [Patent] no. 162299 of 25 Apr 1963), have previously established that saturated aqueous solutions of nitrate salts can, following their thermal or chemical decomposition, be used as binders for the preparation of silica-free molds. In this connection, the authors describe laboratory

Card 1/3

UDC: 621.74.045

L 23083-66

ACC NR: AP5028998

experiments with the construction of molds based on the use of aluminum nitrate as the silica-free binder, with the setting of the mix being a result of the exchange reaction between the aqueous solution of nitrate salt and oxide:

Sieve-screened metallurgical magnesite and chamotte were used as the fillers. On subsequent firing at 950°C the resulting aluminum hydroxide and magnesium nitrate decompose to form high-disperse oxides assuring the strength of the mix in heated state.

The molds were shaped by hand on wood models, dried for 2-3 hr at 300-400°C, heated to 950°C and filled with G13L manganese steel at 1650°C or with L114 steel at 1750°C. Findings: No signs of scorching could be observed on the molds but some parts of their surface displayed bead-like projections which were traced to bubbles of air escaping from their surface; this is a minor technical problem that can be ironed out by a more efficient preparation of the mix. The results confirmed that solutions of nitrate salts and primarily of aluminum nitrate may be used as binders for molding

Card 2/3

L 23083-66

ACC NR: AP5028998

sands. The two major shortcomings of this method -- the release of toxic nitrogen oxides during the firing of the molds and the considerable (2%) shrinkage of the mix -- are technical problems that can be solved. Experiments have shown that the binder  $Al_2O_3$  can be used in the preparation of silica-free molds of sillimanite, zircon, electrolytically produced corundum, and other materials for the vacuum casting of magnets and high-temperature alloys as well as for the casting of Ti and Cr alloys. ABSTRACT: An investigation of viscosity and electric conductivity of Bi-Se, Bi-Te, and Sb-Te alloys over a wide range of temperatures and concentrations has been carried out. On the basis of isotherm analysis, it is shown that bismuth selenide is stable after melting in all temperature ranges investigated. Bismuth telluride dissociates during melting while antimony telluride is relatively stable during melting and begins to dissociate after a certain amount of overheating. The correlation between characteristic concentrations and

TITLE: Study of the thermal emf of germanium and tin tellurides in the solid and liquid state 27 27 27

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 2, no. 5, 1966, 850-854

TOPIC TAGS: germanium compound, tin compound, telluride, thermal emf, electric conductivity, *temperature dependence*

ABSTRACT: The temperature dependence of the thermal emf of tin and germanium tellurides were studied in order to investigate their physicochemical nature and changes in bond character associated with the fusion of these compounds. To this end, a special apparatus was constructed which permitted measurements of differential thermal emf over a wide temperature range in a vacuum or in an inert gas atmosphere in both the liquid and solid state. A correlation was noted between the character of the temperature dependence of the thermal emf and the electrical conductivity of

Card 1/2

UDC: 546.289'241 + 546.811'241

L 29805-66

ACC NR: AP6015068

germanium and tin tellurides in the liquid and solid state. The presence of hole conductivity and the decrease in thermal emf with rising temperature of the melt confirm the conclusion, reached on the basis of electrical conductivity measurements, that these tellurides remain semiconductors after they have melted, and indicate that these substances are not semimetals in the solid state. TOPIC TAGS: tungsten, tungsten compound, tungsten containing alloy, tungsten alloy, THERMODYNAMIC ANALYSIS, METAL ROLLING, METAL OXIDATION

ABSTRACT: Thermochemical calculations of tungsten behavior at various temperatures and residual pressures and conditions under which oxidation cannot occur are presented. The thermodynamic calculations for the oxidation reactions which form  $WO_3$ ,  $W_2O_5$ , and  $WO_2$  are given for temperatures 1200--1600C, and the thermodynamic characteristics (as well as enthalpy and entropy) are tabulated for the tungsten oxides over the temperature range 1473--1873K. The characteristic temperatures of the oxides are given and

Card 1/2

L 07979-67

SOURCE: AN SSSR. Izvestiya, Neorganicheskiye materialy, v. 2, no. 6, 1966, 976-979

TOPIC TAGS: thermal emf, bismuth compound, antimony compound, telluride, selenide

ABSTRACT: The differential thermal emf's of the compounds <sup>27</sup>Bi<sub>2</sub>Te<sub>3</sub>, <sup>27</sup>Bi<sub>2</sub>Se<sub>3</sub>, <sup>27</sup>Sb<sub>2</sub>Te<sub>3</sub> and <sup>27</sup>Sb<sub>2</sub>Se<sub>3</sub> were studied over a wide temperature range (up to 1000°C) in the solid and liquid state. A substantial drop in thermal emf on melting was observed; this is attributed to an increase in the carrier concentration and an equalization of the electron and hole mobilities. The magnitude of this drop is decreased by the "anionic" replacement by a lighter element, due to the tendency of the thermal emf to increase in the liquid phase as Te is replaced by Se. It is shown that the sign of the thermal emf of Sb<sub>2</sub>Se<sub>3</sub> and Bi<sub>2</sub>Se<sub>3</sub> changes after superheating in the liquid state. A correlation was observed between the nature of the temperature dependence of the thermal emf and the electrical conductivity in the solid phase at high temperatures in Sb<sub>2</sub>Te<sub>3</sub>; this is thought to be due to a decrease in deviations from stoichiometry in the Sb<sub>2</sub>Te<sub>3</sub> phase as the temperature rises. On the whole, data on the thermal emf of the

Substitution of limestone by sodium chloride in fluxes of blast-furnace smelting.  
 E. V. BRITZKE, A. N. KAMSTOVNIKOV AND I. B. CHIMANENKOV. *Mineralnoe Suro'e i  
 Tsvetnaya Metallurgiya* 1929, 350-75. The expts. were carried out in a lab. (the furnace of  
 600 cc. capacity). NaCl goes into the slag as Na<sub>2</sub>O and becomes partly volatilized as  
 NaCl. The slag contains 20-70% of the total of Na used. The temp. of the molten  
 NaCl is 800-900°. At this temp. the salt melts and reacts with CO<sub>2</sub> and CaO. As a  
 result of the expts. the most favorable and workable slag was found to contain SiO<sub>2</sub>  
 42.72, FeO 2.25, Al<sub>2</sub>O<sub>3</sub> 15.46, CaO 31.70, MgO 2.56 and Na<sub>2</sub>O 5.04%. Substitution of  
 10.07% CaO by 5.04% of Na<sub>2</sub>O lowers the m. p. of the slag by 400°. S combines with  
 the slag according to the following equation: Na<sub>2</sub>CO<sub>3</sub> + FeS = Na<sub>2</sub>S + FeO + CO<sub>2</sub>.  
 Na<sub>2</sub>S + 2CaO SiO<sub>2</sub> = CaS + Na<sub>2</sub>O SiO<sub>2</sub> + CaO SiO<sub>2</sub>. M. A. JERNAKOFF

*Metall.* 4, No. 4, 35-8 (1935).—From 15° to 540° C =  
 $0.10184 - 1.536 \times 10^{-5} t + 0.877 \times 10^{-7} t^2$ . The heat  
of fusion at 508° is 6780 Cal. per g. mol. wt. H. W. R.

Specific heats of chlorides of copper, lead, nickel and iron at elevated temperatures. A. N. Krasotnikov and G. A. Karetnikov. *J. Gen. Chem.* (U. S. S. R.), 9, 955 (1934).—Av. sp. heats of solid CuCl at temp. intervals of 15-300°, 16-300° and 15-400° are 0.1324, 0.1429 and 0.1524, resp. Sp. heat of liquid CuCl is 0.1600 irrespective of temp. Its heat of fusion is 15-200°, 15-300°, 15-400° and 15-500° are 0.1485, 0.1536, 0.1577 and 0.1581, resp., and those of solid and liquid PbCl<sub>2</sub> at temp. intervals of 15-300°, 15-400°, 15-500°, 15-501°, 15-530°, 15-600°, 15-700° and 15-800° are 0.0447, 0.0727, 0.0894, 0.0910, 0.0910, 0.0910, 0.0910 and 0.0910, resp. The heat of fusion of PbCl<sub>2</sub> is 0.107 cal./g. Av. sp. heats of ZnCl<sub>2</sub> at 15-300° and 15-300° are 0.1000 and 0.1161, resp. Av. sp. heats of solid NiCl<sub>2</sub> at 15-300°, 15-400°, 15-500°, 15-600°, 15-700° and 15-800° are 0.1450, 0.1539, 0.1547, 0.1630, 0.1523 and 0.1470, resp.; thus they show a definite max. Sp. heat of solid FeCl<sub>3</sub> is expressed as  $C = 0.00683 + 2.48 \times 10^{-4} - 1.41 \times 10^{-6} T$ . FeCl<sub>3</sub> melts between 640° and 700° V. A. Kalichevsky

Heat capacities of copper, zinc and lead sulfates at high temperatures. A. N. Krestovnikov and E. I. Felgina. *J. Gen. Chem.* (U. S. S. R.) 6, 1481 (1931). -- The formulas for the true sp. heat capacities of  $\text{CuSO}_4$ ,  $\text{ZnSO}_4$ , and  $\text{PbSO}_4$  are based on the extrapolation of mean heat capacities up to high temps. (2000°K) with the aid of a water calorimeter.

$$\text{CuSO}_4 = 0.1301 + 2.6708 \times 10^{-4} T + 2.0625 \times 10^{-7} T^2$$

$$\text{ZnSO}_4 = 0.1314 + 3.3188 \times 10^{-4} T + 2.755 \times 10^{-7} T^2$$

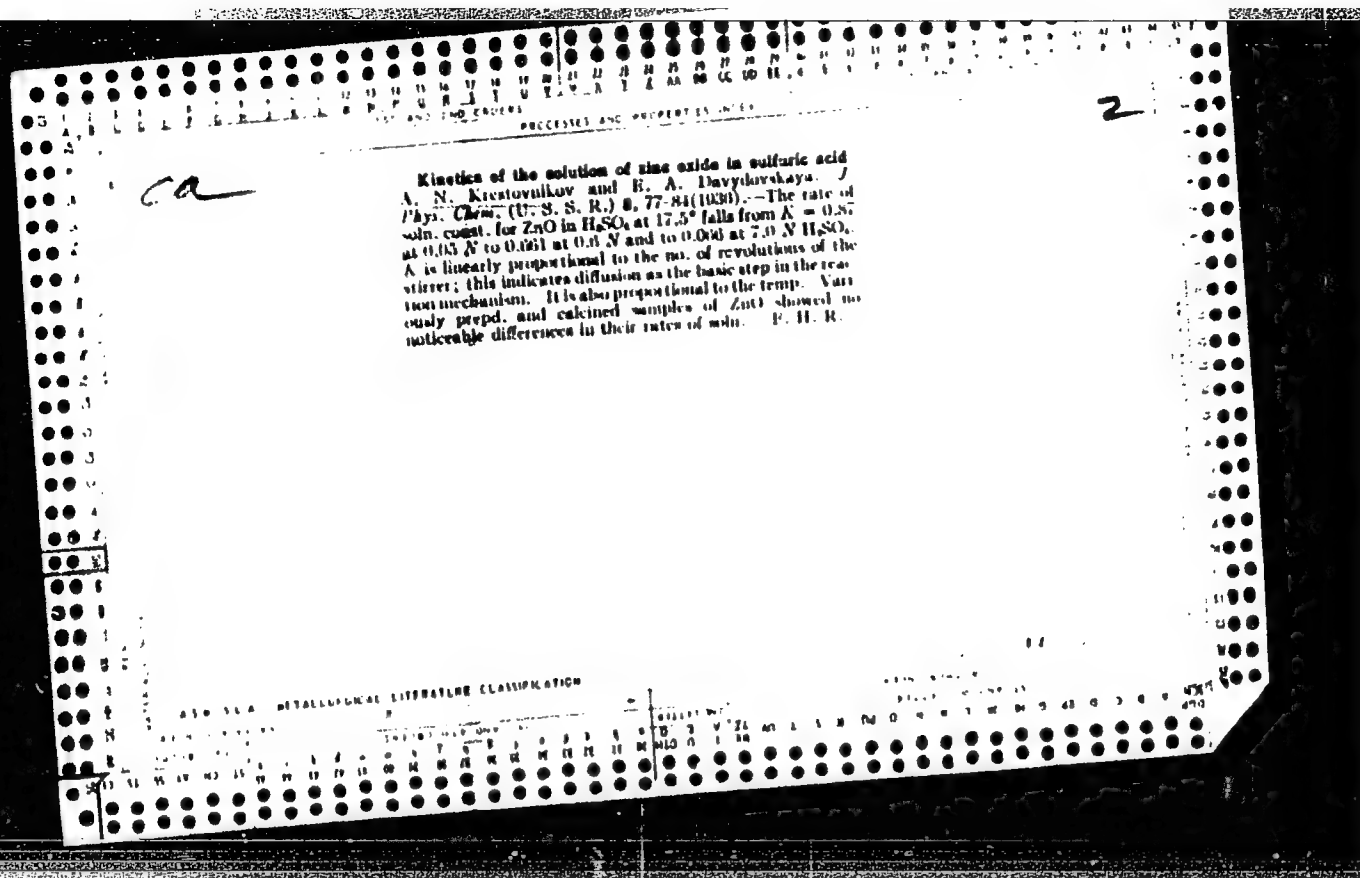

$$\text{PbSO}_4 = 0.1029 + 1.3002 \times 10^{-4} T + 1.0750 \times 10^{-7} T^2$$

The values for mean and true sp. and mol. heat capacities detd. by these formulas agree satisfactorily with the extrapol values of Schott, Ewald (cf. *C. A.* 9, 907), Kopp and Renaud, but are somewhat lower than those calcd. by the formula of Majdel (*C. A.* 24, 2063). Chas. Blanc

Polarization of zinc electrodes as related to changes in the temperature, to composition of the solutions and to presence of neutral salts. A. N. Krestovnikov. *Trudy Moskov. Inst. Khim. Mashinostroyeniya* 1939, No. 7, 133-45; *Khim. Refrat. Zhur.* 1940, No. 7, 77.—The equil. potentials of Zn cathodes (electrolytically Zn-plated Pt wire) were measured by the ordinary Poggendorf compensation method against a calomel half cell under an atm. of  $H_2$  in aq. and aq.-MeOH solns. of  $ZnSO_4$  and  $ZnCl_2$ . Increasing the temp. and the concn. of MeOH decreases the equil. potential of Zn. Addn. of neutral salts ( $Na_2SO_4$  and  $MgSO_4$ ) has no appreciable effect on the results. Polarization measurements were made with agitated

$ZnSO_4$  solns. and with the addn. of other compds. to these in the presence of air with cathodes of Zn-plated Cu. The velocity of stirring affected the velocity of establishing the potential. Polarization increased with increase in the c. d. and increase in concn. of MeOH and glycerol. The rate of polarization increased considerably with decrease in  $ZnSO_4$  concn. (especially with high concns. of MeOH). Addn. of neutral salts increased the polarization as follows:  $Al > NH_4 > Na > K > Mg$ ; and  $NO_3 > SO_4 > Cl > Br > CNS > I$ . W. R. Henn

Title: Kinetics of Etching of Zinc Used in Printing by the Chemical Method

Original

Publication: Nauch. tr. Mosk. poligr. i-nt, 1955, 3, 135-142

Abstract: Investigation of the rate of dissolution of sheet Zn used in the printing industry, in mixtures of HCl and  $\text{HNO}_3$  (using 15 (I), 10 (II) and 5 (III) % by weight of each component in the mixture), by the method of determination of loss in weight (LW) after 5 minutes of etching (E). The E in I was started at  $25^\circ$  and terminated at  $\sim 100^\circ$  due to natural heating. Mixtures II and III were heated at  $80^\circ$  before E, so that the temperature of these mixtures attained  $\sim 90^\circ$  at the end of E. It is shown that with all other conditions being equal,

Card 1/2

Abst Journal: Referat Zhur - Khimiya, No 2, 1957, 5111

Abstract: LW decrease in the series  $I > II > III$ . Increase in the volume of the solution from 100 to 1,100 ml, results, in general, in greater LW, and this effect increases in the series  $III < II < I$ . On decrease of the effective surface of the Zn the LW decreases in III and undergoes no change in I. The last mentioned effect is attributed to attainment, in I, of the saturation level of E products concentration, due to a high rate of dissolution. Using III as an example it is shown that the speed of stirring of the solution produces no substantial effect on LW.

TITLE: Lecture Demonstrations on Chemical Kinetics (O lektsionnykh demonstratsiyakh po khimicheskoy kinetike)

PERIODICAL: Vestnik vysshey shkoly, Feb 1957, # 2, p 67-68 (USSR)

ABSTRACT: The author begins with the statement that there are no manuals describing demonstrations of physical chemistry, which causes the lecturer much difficulty when he tries to teach by illustration. One of the most interesting sections of physical chemistry is chemical kinetics, but there are few means of demonstrating experiments in this science. For some years, the instructors of the Chair of Physical Chemistry of the Moscow Institute of non-ferrous Metals and Gold, in the course of their lectures, have shown experiments illustrating the peculiarities of chemical reaction kinetics. For this purpose the reaction of resolving hydrogen peroxide is being used. The author goes on to describe the various phases of resolution and then describes 3 more experiments.

TITLE: Kinetics of the Dissolution of Copper in a Mixture of Sulfuric Acid and Ammonium Nitrate (Kinetika rastvoreniya medi v smesi sernoy kisloty s azotnokislym ammoniyem)

PERIODICAL: Sb. nauchn. tr. Mosk. in-t tsvetn. met. i zolota i VNITO tsvetn. metallurgii, 1957, Nr 26, pp 212-221

ABSTRACT: The rate of dissolution of Cu in a mixture of  $H_2SO_4$  and  $(NH_4)NO_3$  rises with the strength of the acid. A considerable speed is attained at a concentration of 400 g/l  $H_2SO_4$  at room temperature and at 100 g/l at  $60^\circ C$ . The amount of Cu going into solution is virtually directly proportional to the duration of the contact. The rate of solution of Cu rises with increase in the strength of the  $(NH_4)NO_3$ . Calculation of the relationship between the rate and the temperature shows that the process of dissolution of Cu is diffusive at temperatures under  $50^\circ$  and becomes kinetic at higher temperatures.

TITLE: Specific Heat and Heat Content of Magnesium (Teployemkost' i teplosoderzhaniye magniya)

PERIODICAL: Sb. nauchn. tr. Mosk. in-t tsvetn. met. i zolota i VNITO  
tsvetn. metallurgii, 1957, Nr 26, pp 222-226

ABSTRACT: The bibliographic data on the specific heat  $C_p$  and the heat content  $H_p$  of magnesium for ultra-low, low, room, and high (up to  $1500^\circ\text{C}$ ) temperature is critically examined and recommendations are given for their utilization in thermodynamic and metallurgical calculations. For the calculation of  $C_p$  in the interval  $0-651^\circ$  (melting point) the following equation is proposed:  $C_p = 5.85 + 2.8 \cdot 10^{-3} t$ ; for the calculation of  $H_p$  (in the same range) the equation;  $H_p = 5.85t + 1.4 \cdot 10^{-3} t^2$  is set forth.

TITLE: Specific Heat of Chromium Boride (Teployemkost' borida khroma)

PERIODICAL: Sb. nauchn. tr. Mosk. in-t tsvetn. met. i zolota, Nauchno-tekhn. o-vo tsvetn. metallurgii, 1957, Nr 30, pp 135-137

ABSTRACT: The mean specific heat of  $\text{CrB}_2$  (70% Cr, 29.9% B, 0.05% C, 0.40% Fe) was determined on a water calorimeter set for the temperature range from room temperature to 300, 400, 500, 600, 700, and 800°C. On the basis of the data obtained the following equation for the relationship of specific heat to temperature was developed by the method of least squares:  $c = 0.1342 + 1.03 \cdot 10^{-4} T$ . An equation for the true specific heat capacity,  $c = 0.1061 + 2.06 \cdot 10^{-4} T$ , was also obtained.

TITLE: The Heat Capacity of Copper, Zinc, and Lead and the Influence of Heat-capacity Data Scatter on the Equilibrium Constant of the Elementary Oxide and Sulfide Reduction Reaction (Teployemkosti medi, tsinka i svintsa i vliyaniye razbrosa dannykh po teployemkostyam na konstantu ravnovesiya elementarnoy reaktsii vosstanovleniya okisla i sul'fida)

PERIODICAL: Sb. nauchn. tr. Mosk. in-t tsvetn. met. i zolota, Nauchno-tekhn. o-vo tsvetn. metallurgii, 1957, Nr 30, pp 235-253

ABSTRACT: A study is made of the influence of heat-capacity data scatter versus temperature for the reduction reactions of certain oxides and sulfides of heavy nonferrous metals. Two methods of analysis are employed. The first method is based on direct experimental determination of reaction equilibrium, upon which the equilibrium constant  $K_p$  is then calculated for the given temperature. The expanded equation for the reaction isochores and isobars is employed to find the free energy,  $\Delta Z$ . This method permits only implicit determination of

Card 1/2

SOV/137 58-11 21954

The Heat Capacity of Copper, Zinc, and Lead (cont.)

the influence of scatter of  $c_p$  data upon  $K_p$ , i.e., in the form of the influence of scatter upon the integration constant. Therefore, analysis by the first method is performed only for the reduction reactions of  $Cu_2O$ ,  $ZnO$ , and  $ZnS$  by  $CO$  and  $H_2$ . The second method of analysis involves the utilization of tables of standard values and the Temkin-Shvartsman method of calculation. This method is used to study the influence of  $c_p$ -data scatter versus temperature upon the  $K_p$  of the reactions of  $Cu_2O$ ,  $Cu_2S$ ,  $ZnO$ ,  $ZnS$ ,  $PbO$ , and  $PbS$  with  $CO$  and  $H_2$ . The influence of  $c_p$ -data scatter upon  $K_p$  is determined in explicit form and it is shown that these values are of identical orders of magnitude.

TITLE: Determining the Free Energy of Zinc Ferrite Formation (K voprosu opredeleniya svobodnoy energii obrazovaniya ferrita tsinka)

PERIODICAL: Sb. nauchn. tr. Mosk. in-t tsvetn. met. i zolota, nauchno-tekhn. o-vo tsvetn. metallurgii, 1957, Nr 30, pp 362-367

ABSTRACT: The reduction of Zn ferrite by carbon monoxide and dissociation of the ferrite are experimentally studied with the object of calculating the free energy of the reaction of zinc ferrite formation from ZnO,  $\text{Fe}_2\text{O}_3$ , and  $\text{O}_2$ . A monometric method of determining the ferrite dissociation pressure made possible a more precise calculation of the isobaric reaction potential. The dissociation pressures and free energies of dissociation of Zn ferrite in the 1200-1300°C range are presented. The free energies of Zn ferrite formation from the elements are confirmed by calculations on the data of other authors. The results obtained yield the free energy of ferrite formation in the 1000-1300° interval, which is 1-3 kcal/mole, indicating that Zn ferrite is unstable under these conditions.

Povedeniye zolota v zone okisleniya zoloto-sul'fidnykh mestorozhdeniy  
(Behavior of Gold in the Oxidation Zone of Gold-Sulfide Deposits)  
Moscow, Gosgeoltekhizdat, 1958. 266 p. 3,000 copies printed.

Ed. of Publishing House: V.P. Skvortsov; Tech. Ed.: K.V. Krynochkina

PURPOSE: This book is intended for geologists, mineralogists, and  
other scientists studying gold-bearing ores and gold deposits.

COVERAGE: The work attempts to create a practical basis for appraising  
the importance of primary and secondary ore zones containing gold  
deposits resulting from hypergenetic migration. Minerals containing  
native gold in macroscopic, microscopic, and submicroscopic quan-  
tities, as well as the regions in which these minerals occur, are  
indicated. The authors cite references to studies made on the  
genesis of hypogene and supergene gold. Gold solution and its re-  
action in liquids having a different chemical composition are

Card 1/4

discussed, and findings from numerous experiments are analyzed. The Maykain and Dzhusely deposits of Kazakhstan and the Blyava and Novyy Sibay deposits of the Southern Urals are analyzed geologically and mineralogically and the results presented in tables and graphs. Results of microscopic analysis of gold are also discussed and illustrated. This work has been completed under the direction of V.M. Kreyter who wrote Chapters I, V, and VI. Chapter III and the first and second parts of the Chapter II were written by V. V. Aristov. Chapter VII and the third part of the Chapter II were written by I.S. Volynskiy. V.V. Kuvichinskiy wrote the first part of Chapter IV. Numerous Soviet geologists and mineralogists are mentioned in the text. The authors thank P.S. Belov, former Chief Engineer of the Zolotorazvedga Trust, I.N. Plaksin, T.N. Shadlun, D.S. Kreyter, and G.G. Rusetskaya. The book contains numerous pictures, graphs and tables. There are 120 references: 78 Soviet, 27 English, 12 German, 3 French.

TITLE: The Specific Heat of Zirconium Boride (Teployemkost' borida tsirkoniya)

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Razd. tsvetn. metallurgiya, 1958, Nr 1, pp 73-75

ABSTRACT: The average specific heats of Zr boride are (in cal/g): for 20-400°C, 0.1332; for 20-500°, 0.1369; for 20-600°, 0.1414; for 20-700°, 0.1410; and for 20-800°, 0.1442. The data obtained are used to compile equations for the average and true specific and molecular heat capacities. The deviation of the values found from those calculated by the Maydel' equation (by the rule of additivity) is <10%.

(Issledovaniye diagrammy sostoyaniya med'-titan).

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1958, No.2, pp. 145-148 (USSR).

ABSTRACT: The method of zonal recrystallisation and thermal analysis was used by the author for solving the problem of presence of eutectic transformation  $L \rightarrow \alpha + \beta$  taking place at the temperature  $870 \pm 1^\circ\text{C}$  for a composition at the eutectic point of 17.1% Ti. The solubility of titanium in copper was determined by micro-hardness measurements; 7.4% Ti is the maximum limit solubility at the temperature of the eutectic horizontal. The results graphed in Fig.3 of the changes of the chemical composition along the length of a specimen of an alloy with 17.6% Ti content after zonal recrystallisation (head and tail parts) indicate the existence of a range of homogeneity corresponding to the inter-metallide  $\beta(\text{Cu}_3\text{Ti})$ , the lower limit of which is about 19.6% Ti at the eutectic temperature; the micro-hardness of the compound equalled  $370 \pm 15 \text{ kg/mm}^2$ . On

TITLE: Microhardness Measurements in the Study of Solid Solutions of the Three Component Systems (Issledovaniye tverdykh rastvorov trekhkomponentnoy sistemy metodom mikroverdsti)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1956, Nr 3, pp 110-113 (USSR)

ABSTRACT: A series of Cu-Al, Cu-Ti, and Cu-Al-Ti alloys were prepared for experiments, the aim of which was to establish the ultimate solubility of Al and Ti in Cu and to investigate the dependence of the microhardness of a solid solution on the composition of the alloys. Changes in the microhardness with respect to composition and temperature of Cu-Al and Cu-Ti alloys allowed establishment of the most probable limit of the solubility of Ti in Cu, the "Solidus" temperature and the limit of the solubility of a ternary solid solution. Microhardness versus composition curves confirmed a complicated structure of the solid solution in the two phase system - the microhardness of such solid solutions increased as the composition of the alloy entered the two-phase region. Changes in the microhardness of a solid solution obtained from the study of one-phase and two-phase systems served to plot the solubility isotherms and thus supplied information regard

Card 1/3

24-5-3-14/90

Microhardness Measurements in the Study of Solid Solutions of the Three Component Systems.

ing the solubility of Al and Ti in Cu. Analysis of these results has shown that the introduction of Ti essentially increases the solubility of Al in Cu especially at higher temperatures and the introduction of Al lowers the solubility of Ti in Cu. Hardening of the solid solution which accompanies the solubility of Al and Ti in Cu could be produced to a certain extent by a relative mutual solubility of the components. This mutual solubility is governed by the atomic structure, type, and the dimensions of the crystal lattice of the component. As the solubility of Ti in Cu is accompanied by a larger alteration of the crystal lattice than in the case of the solubility of Al in Cu it is to be expected that the microhardness due to Ti will be greater than that due to Al with respect to the same Cu content of an alloy. This was confirmed experimentally and is in accordance with theoretical interpretation. The introduction into the metal lattice of Cu (highly "populated" by s-electrons) of a transition metal, Ti (which has 3d subgroup not completely filled by electrons) leads to extra stronger valency forces which are

Card 2/3

24-53-3-14/38

Microhardness Measurements in the Study of Solid Solutions of the Three Component Systems.

due to an "overlapping" of these s and d electrons. Thus the addition of 1% Ti (by weight) increases the microhardness by 33 kgm/mm<sup>2</sup> whereas the same addition of Al (by weight) by only 12.4 kgm/mm<sup>2</sup>. The increase in the microhardness of the studied alloys was found to be proportional and linear up to the ultimate concentration. In the case of ternary solid solutions the increase in the microhardness was found to be the sum total of the increases in the microhardness of the corresponding binary solid solutions. There are 5 figures and 8 references, all of them Soviet.

(Nekotoryye zakonomernosti v diagrammakh sostoyaniya dvoynykh  
metallicheskih sistem)

PERIODICAL: Sb. nauchn. tr. Nauchno-tekhn. o-vo tsvetn. metallurgii, Mosk.  
in-t tsvet. met. i zolota, 1958, Nr 29, pp 5-9

ABSTRACT: On the basis of a survey of the liquidus curves of real binary  
metallic systems comprising intermetallic compounds which have  
either a singular point or nonsingular gently-shaped maxima the  
authors derive an equation that satisfies the liquidus curves and the  
loop formed by a curve that intersects itself at the singular point.

TITLE: Kinetics of Dissolution of Binary Solid Copper-Based Solutions (With the Same Atomic Percentage Composition) in a Solution of Sulfuric Acid

PERIODICAL: Sb. nauchn. tr. Nauchno-tekhn. o-vo tsvetn. metallurgii. Mosk. in-t tsvetn. met. 1 zolota, 1958, Nr 29, pp 196-198

ABSTRACT: The study of the rate of dissolution of binary solid solutions of <sup>27</sup>Ni, <sup>27</sup>Zn, <sup>27</sup>Al and <sup>27</sup>Mn (5 atomic %) on <sup>27</sup>Cu base in 60% - H<sub>2</sub>SO<sub>4</sub> at 80°C, which has been determined by the analysis of the solution and by the change in the weight of the samples after every 100 hours in the course of 1,000 hours, has shown that this rate increases along the series Ni < Zn < Al < Mn. The content of Mn in the solution in the dissolution of Mn-Cu-alloy is ~5 atomic %. The Ni, Zn and Al content in individual samples of the solution varies from 4 to 9 atomic %.
